

Advanced Econometrics: Time Series Models

Syllabus: Version 1 (August 22, 2022)

Instructors: Mikkel Plagborg-Moller, mikkelpm@princeton.edu
Mark Watson, mwatson@princeton.edu

Lectures: Mon/Wed 9.00–10.30am, JRRB 298

Office hours: Wed 10.30–11.30 am, JRRB 282

Website: <https://princeton.instructure.com/courses/8816>

Description. Concepts and methods of time series analysis and their applications to economics. Time series models to be studied include simultaneous stochastic equations, VAR, ARIMA, and state-space models. Methods to analyze trends, second-moment properties via the auto covariance function and the spectral density function, methods of estimation and hypothesis testing and of model selection will be presented. Kalman filter and applications as well as unit roots, cointegration, ARCH, and structural breaks models are also studied.

Prerequisites. ECO 517 and 518, or equivalent. Students from outside the Economics PhD program should contact the instructors to obtain permission to take the course.

Material. There is no required textbook for the course. Handouts will be made available on the website. Attached to this syllabus is a list of optional readings that are useful for a deeper understanding of the material in the first half of the course.

Some students might find it useful to have a textbook as an additional reference. Good reference books include:

Brockwell, P. J., and Davis, R. A. (1991). *Time Series: Theory and Methods*. 2nd edition, Springer. (Beautiful mathematical treatment of the classic theory of covariance stationary time series, but not aimed at economists.)

Hamilton, J. D. (1994). *Time Series Analysis*. Princeton University Press. (Comprehensive reference for time series econometrics methods developed before the mid-1990s.)

Hayashi, F. (2000). *Econometrics*. Princeton University Press. (Accessible treatment of GMM and stochastic limit theory for time series data.)

Herbst, E. P., and Schorfheide, F., (2015). *Bayesian Estimation of DSGE Models*. Princeton University Press. (Recent reference on Bayesian inference in structural time series models.)

Kilian, L., and Lütkepohl, H. (2017). *Structural Vector Autoregressive Analysis*. Cambridge University Press. (Recent reference on SVAR methods.)

Homework. Problem sets will be posted on the course website approximately every one or two weeks. Students are encouraged to collaborate on the problem sets, but answers and computer code must be typed up independently. The problem sets will be graded coarsely, i.e., a full score will be given as long as the work demonstrates dedication and thoughtfulness. We reserve the right to subtract points for sloppy exposition, including unreadable code. If you find a grading error, please resubmit your problem set along with a one-paragraph explanation; we reserve the right to re-grade the entire problem set.

Exams. The course will feature a midterm and a final exam. The midterm will cover the first half of the course, while the final will cover the second half. The midterm will be in the form of a take-home exam with no collaboration allowed.

Grading. The final course grade will be a monotonic function of the simple average of the point scores in each half of the course. In the first half of the course, the point score is given by a weighted average of (i) the average problem set score (25% weight) and (ii) the midterm score (75% weight).

Code of conduct. All course activities, including class meetings and homework assignments, are subject to the university's academic code and code of conduct as detailed in the "Rights, Rules, Responsibilities" publication.

Accommodations for students with disabilities. Students must register with the Office of Disability Services (ODS) (ods@princeton.edu; 258-8840) for disability verification and determination of eligibility for reasonable academic accommodations. Requests for academic accommodations for this course need to be made at the beginning of the semester, or as soon as possible for newly approved students, and again at least two weeks in advance of any

needed accommodations in order to make arrangements to implement the accommodations. Please make an appointment to meet with the instructor in order to maintain confidentiality in addressing your needs. No accommodations will be given without authorization from ODS, or without advance notice.

Important dates. These dates are preliminary. Changes will be announced via course email.

Sep 7 (Wed): First class with M. Plagborg-Moller

Oct 17 (Mon) and Oct 19 (Wed): No class due to Fall Recess

Oct 24 (Mon): Last class with M. Plagborg-Moller

Oct 26 (Wed): First class with M. Watson

Nov 23 (Wed): No class due to Thanksgiving Recess

Dec 7 (Wed): Last class with M. Watson

Course outline: Sep 7 – Oct 24. The following outline is preliminary and may change without warning.

1. Refresher: Stationary models.
 - i) Strict/covariance stationarity, projection.
 - ii) Lag operators, linear filters, VARMA.
 - iii) Wold decomposition.
 - iv) Likelihood factorization, estimation.
 - v) Model selection.
2. Spectral analysis.
 - i) Spectrum of linear filter.
 - ii) Estimation: sieve-VAR, periodogram smoothing.
3. Inference with weakly dependent data.
 - i) Central Limit Theorem, martingale difference sequences, mixing.

- ii) Heteroskedasticity and Autocorrelation Consistent inference.
 - iii) Applications to GMM, moment matching.
 - iv) Bootstrap.
4. Causal identification in macroeconomics.
- i) SVMA, SVAR, relationship with structural models.
 - ii) Invertibility, recoverability.
 - iii) Identification through exclusion restrictions.
 - iv) Local Projection versus VAR estimation of impulse responses.
 - v) Identification using instruments/proxies.
 - vi) Partial identification through sign/magnitude restrictions.
 - vii) Identification through non-Gaussianity/heteroskedasticity.
 - viii) Nonlinear models.
5. Introduction to state space models.
- i) Linear-Gaussian models, Kalman filter and smoother.
 - ii) Basics of Markov Chain Monte Carlo.
 - iii) Estimation of linearized DSGE models.
 - iv) Regime switching.

Optional reading list

Introductory readings are listed first and marked with a star (*). Other readings are included for your reference. Original contributions are not always cited when good hand-book/textbook references are available. The reading list is preliminary and may change without warning.

1 Stationary models

Models, prediction, estimation

* Hayashi: chapters 6.1–6.4.

* Kilian and Lütkepohl: chapters 2.1–2.5.

Brockwell and Davis: chapters 1.1–1.5, 2.1–2.9, 3.1–3.5, 5.1–5.5, 5.7, 11.1–11.4.

Hamilton: chapters 2–4, 10–12.

Herbst and Schorfheide: chapters 3.1–3.2.

Kilian and Lütkepohl: chapters 2, 5.

Model selection

* Kilian and Lütkepohl: chapter 2.6.

Brockwell and Davis: chapter 9.

Claeskens, G., and Hjort, N. L. (2008). *Model Selection and Model Averaging*. Cambridge University Press. Chapters 1–4.

Geweke, J., and Meese, R. (1981). “Estimating regression models of finite but unknown order.” *International Economic Review* 22(1), 55–70.

Hansen, B. E. (2005). “Challenges for Econometric Model Selection.” *Econometric Theory* 21(1), 60–68.

Leeb, H., and Pötscher, B. M. (2005). “Model Selection and Inference: Facts and Fiction.” *Econometric Theory* 21(01), 21–59. Sections 1–2.

Applications

- Bernanke, B. S., and Kuttner, K. N. (2005). “What Explains the Stock Market’s Reaction to Federal Reserve Policy?” *Journal of Finance* 60(3), 1221–1257.
- Sims, C. A. (1972). “Money, Income, and Causality.” *American Economic Review* 62(4), 540–552.
- Stock, J. H., and Watson, M. W. (2003). “Forecasting Output and Inflation: The Role of Asset Prices.” *Journal of Economic Literature* 41(3), 788–829.

2 Spectral analysis

Representation theory and inference

* Hamilton: chapter 6.

Brockwell and Davis: chapters 4, 10.1–10.5, 11.6.

Berk, N. (1974). “Consistent Autoregressive Spectral Estimates.” *Annals of Statistics* 2(3), 489–502.

Hannan, E. J. (1970). *Multiple Time Series*. John Wiley & Sons. Chapters III.2–3, III.5.

Applications

- Dew-Becker, I., and Giglio, S. (2016). “Asset Pricing in the Frequency Domain: Theory and Empirics.” *Review of Financial Studies* 29(8), 2029–2068.
- King, R. G., and Watson, M. W. (1996). “Money, Prices, Interest Rates and the Business Cycle.” *Review of Economics and Statistics* 78(1), 35–53.
- Qu, Z., and Tkachenko, D. (2012). “Frequency Domain Analysis of Medium Scale DSGE Models with Application to Smets and Wouters (2007).” In *Advances in Econometrics, Volume 28: DSGE Models in Macroeconomics – Estimation, Evaluation and New Developments*, edited by Balke, N., Canova, F., Milani, F., and Wynne, M. A., Emerald Group Publishing, 319–385.
- Sala, L. (2015). “DSGE Models in the Frequency Domain.” *Journal of Applied Econometrics* 30(2), 219–240.

Sargent, T. J., and Surico, P. (2011). “Two Illustrations of the Quantity Theory of Money: Breakdowns and Revivals.” *American Economic Review* 101(1), 109–128.

Watson, M. W. (1993). “Measures of Fit for Calibrated Models.” *Journal of Political Economy* 101(6), 1011–1041.

3 Inference with weakly dependent data

Theory

* Hayashi: chapters 2, 6.5–6.6.

Brockwell and Davis: chapters 6–7.

Hamilton: chapter 7.

Davidson, J. (1994). *Stochastic Limit Theory*. Oxford University Press. Chapters 13–14, 24.

GMM, moment matching

* Hayashi: chapters 7.1–7.4.

Cocci, M. D., and Plagborg-Møller, M. (2021). “Standard Errors for Calibrated Parameters.” Manuscript, Princeton University.

Hansen, L. P., Heaton, J., and Yaron, A. (1996). “Finite-Sample Properties of Some Alternative GMM Estimators.” *Journal of Business & Economic Statistics* 14(3), 262–280.

Hansen, L. P., and Heckman, J. J. (1996). “The empirical foundations of calibration.” *Journal of Economic Perspectives* 10(1), 87–104.
